- Typing in the Unique Code
- Reading the 2-D code with a 2-D scanner
- Using a mobile phone (Nokia Nseries, Eseries)

TERMS OF BUSINESS

IMPORTANT

Reproduction of this catalogue or parts thereof is only allowed with our explicit permission in writing. Pictorial representations and design are copyrighted. Claims for damages, of any form whatsoever, resulting from details made in this catalogue or from incorrect use, application, storage or handling, are explicitly excluded. Contractual rights and any resulting or related claims based thereon, irrespective of form, initially come into being on the basis of a separate written agreement, in particular on the basis of our general terms of sale and delivery.
All former statements lose their validity with the publication of this catalogue.
The catalogue is not an operating manual for the use and installation of belts and timing belt kits. It does not contain any advice in a legal sense. The catalogue neither replaces the constantly applicable technical regulations – particularly for tolerances – nor the installation and maintenance stipulations of the individual engine manufacturer.
Also, it is not possible to forego the expertise of those carrying out the installation and application. The individual references made in this catalogue for the installation and the application of belts and timing belt kits are instructions solely for the technically qualified specialist and are to be checked and verified by them for their suitability in each case. Federal-Mogul accepts no responsibility for application decisions.
The contents of the catalogue are not intended to create or substitute any contractual agreement which has to be reserved exclusively to a separate agreement between 2 identified parties, whereby seller can be only one of our Federal-Mogul entities as mentioned on the inside back cover.
The right is retained to correct errors and alterations, particularly with regard to amendments in the engine manufacturers' details and stipulations.

TIMING BELT TROUBLE TRACER CHART

SYMPTOMS

Noise prior to failure: Whining from over tightness. Failing belt whipping the enclosure. Slapping noises from a slack belt.
Failure: A few popular engines are designed such that the valves when fully open will not contact the piston at top dead centre. Cam belt breakage will stop the engine but should not cause any damage.

However, on most engines, timing belt failure results in major damage. Valve to piston contact often occurs requiring replacement of valves, valve guides, camshaft pistons, and possibly cylinder head and block repair.

SERVICE TIPS

Do not refit a timing belt. Engine manufacturers specify the tension to which a new belt should be set. In operation however, the tension will relax slightly to a lower value. If a used belt was refitted, and tensioned to the manufacturer's figure for a new belt, it would run too tight in use. As it is almost impossible to refit a belt to the tension it ran at before removal, it is recommended that belts should never be refitted.
Change your belt at the interval specified by the vehicle manufacturer. Due to the constant flexing the fibres of the tension cords eventually fatigue, and break. The life of a belt depends upon many factors including: the tensile forces it transmits, its width, its overall length, the design of the cords, the size of the pulleys and the torsional vibration characteristics in the engine.

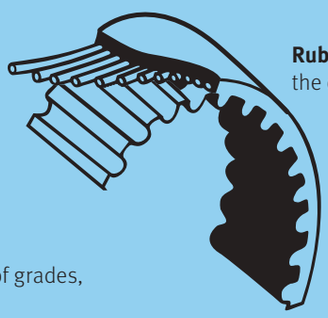
The manufacturers replacement period has been established so that a belt is renewed before the fatigue may cause it to fail, and should be adhered to.

Storage of timing belts. Timing belts are rubber composite products and as such should be stored away from sunlight, oil, water and solvents. They should not be crushed or bent tightly, for example by hanging on a peg.

BELT CONSTRUCTION

Tension member:
fibre-glass cord wound round the belt

Facing fabric:
An elastic nylon facing which gives a hard-wearing surface, and polishes to a smooth, low-friction finish



Rubber stock: moulded and cured around the cords and the facing fabric

Each of these materials is available in variety of grades, which are matched to a belt's application.

GENERAL REMEDY

All failures require the engine to be rebuilt to the manufacturers specification replacing all damaged components. In particular, ensure that:

- The belt is correctly tensioned.
- The tensioner mechanism operates correctly and is properly secured.
- All idler wheels and auxiliary shafts rotate freely.
- The gears are clean, undamaged, and in alignment.
- The enclosure is in good order.
- Any oil leakage into the enclosure has been stopped.

FOREIGN BODY ENTRAPMENT

Symptom: Belt breakage, in a curved or ragged tear.
Cause: A foreign body has become trapped in the drive and has over-stretched and broken the tensile cords.
Remedy: Attempt to locate and identify foreign body (nut, bolt, washer etc). Ensure belt enclosure is effective. Set new belt tension and ensure tensioner mechanism is tight.

EDGE WEAR

Symptom: Excessive wear and damage to the belts edge.
Cause: Damaged gear flange, or misaaligned gears.
Remedy: Replace damaged gears and ensure correct belt alignment.
Set new belt to correct tension an ensure tensioner mechanism is right.

LAND WEAR

Symptom: Wear, or polishing, on the lands between the teeth, possibly wearing down to the tension cords' with polishing on the tooth crests of trapezoidal belts.
Cause: Excessive tension, causing the belt to wear on the gear lands. Rough gears abrading the belt.
Remedy: Replace gear(s) if required. Set new belt to correct tension and ensure tensioner mechanism is tight.

TOOTH PEEL

Symptom: Teeth peeling, emanating from root cracks. Often is present together with tooth shear.
Cause: Very low tension allowing the belt to jump teeth.
Remedy: Set new belt to correct tension and ensure tensioner mechanism is tight.

TOOTH SHEAR

Symptom: Six or more teeth missing, often with cracking in roots of a number of teeth.
Cause: May be due to sudden overload of the drive from the seizure of a driven part, such as a water pump.
Also may be due to low tension, which allows the belt to ride high on the gear, producing excessive bending moments, and deflection of the teeth until cracks form.
Remedy: Ensure all driven items rotate smoothly.

Set new belt to correct tension and ensure tensioner mechanism is tight.

TOOTH WEAR

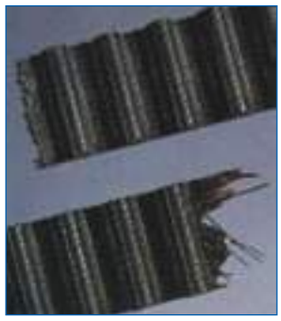
Symptom: Hollows through the facing fabric.
Cause: Extremely low tension allows the belt to ride out on the gear, causing localised wear on edge of the thrust face. Sometimes excessive tension, pulling the belt up the land, may wear the tooth face, before a tensile failure.
Remedy: Set new belt to correct tension and ensure tensioner mechanism is tight.

OIL CONTAMINATION

Symptom: Dirty or smelly belt, with a ragged decomposing structure.
Cause: Contamination from a failed oil seal, or an oil or diesel leak, breaks down the adhesion of the rubber. Swelling can also occur and cause mismeshing leading to other types of failure.
Remedy: Ensure oil leak is stopped. Check belt enclosure and dust shields. Set new belt to correct tension and ensure tensioner mechanism is tight.

TENSILE FAILURE

Symptom: Tensile breakage, with a straight break between two teeth.
Cause: Some of the tensile cord's fibres have broken due to crimping (folding) before or during assembly, creating a weak point. A belt running over-tensioned may sometimes cause teeth to ride up onto gear lands, resulting in vast over stretching and tensile failure.
Remedy: Replace belt carefully, without pinching or levering. Set new belt to correct tension and ensure tensioner mechanism is tight.



BACK CRACKS

Symptom: A series of cracks across the back of the rubber stock.
Cause: The rubber has been over-heated and has degraded, possibly from friction on a seized idler or water pump. Extreme cold may have the same effect.
Remedy: Ensure all spindles driven off the back of the belt, including water pumps, rotate freely. Set new belt to correct tension and ensure tensioner mechanism is tight.
